

# ProFlamingo

The Great Aim Of Education Is Not  
Knowledge But Action.

# Problem statement

A smart online test system for students to prepare for exams, in which user cant switch to applications and websites while giving test. The system should include a video calling feature and a robot chat option for each question, to enhance understanding and improve the exam preparation experience.

# Introduction

We are developing an online test launch system for students and teachers to organize and prepare for exams and competitive tests , this system is designed in such a way that it will prevent students from switching to any other application or website while giving the test.

The system also includes video features and a robot chat option for each question for kind of assistance.

And also we will be providing some additional feature too.

# Solution

The camera and bot feature would allow students to connect with teachers for real-time assistance and the robot chat option(bot) would help for solving problems, allowing students to receive immediate feedback and clarification on their responses.

Basically, this system would work by requiring the student to log in and start the exam. Once the exam begins, the student would not be able to switch to any other applications or websites until the exam is completed.

This would prevent cheating and ensure that the student is fully focused on the exam.

# Additional features

It provides feature such as placement preparation, interview preparation and courses.

It also includes a video calling feature that would allow the student to connect with a teacher or tutor. If they have any questions or need clarification on a particular question.

We are using a technique called the "Pomodoro technique" for online courses. It is a time management method that helps individuals increase their productivity and focus.

**Thank You**
